## **Notification management**

Applied Computing Project 1  
Computer science degree program  
11/2016

## PURPOSE OF THE PROJECT

The purpose of our project is to offer something that helps everyone in their everyday life. Our goal is to ease our customers stress and give them a chance to fully focus on what they want. Because of this we are designing an app, that lets the user delay her/his notifications the way he/she wants.

During the project we want to push to our limits as a group and as individuals, and this way offer as much as we can to our future customers. On the way, we want to scientifically study the user response of processing disruptive notifications of their smart devices, and understand our users even better.

While notifications keep an user informed and engaged with events around mobile applications, they do not have the same importance level to an user and the timing of a notification is also a factor in the perceived importance. [1, 2]

The emphasis in the user experience of our application is to allow the most effective processing of notifications in the most user friendly way.

In the process of development we use a prioritization technique called the MoSCoW method, which allows the dynamic planning of the implementation. We are gathering all user feedback, which may affect also to minimum requirements. Getting enough user feedbacks is challenging, but we will put the effort to it in the early phase of the development to gain as much information as possible.

**Key words:** Notification management, android, notification delay

## GLOSSARY

Push notification	A push notification notifies the user of new messages or events in the application. The devices might show an icon and a message in the status bar. Tapping the notification opens the main view of the cause.
The MoSCoW method	This is a prioritization method, which has four categories for requirements. Categories are <i>must have</i> , <i>should have</i> , <i>could have</i> and <i>won't have</i> .
The AWARE framework	AWARE is an Android framework dedicated to instrument, infer, log and share mobile context information, for application developers, researchers and smartphone users. AWARE captures hardware-, software-, and human-based data.

## 1. DESIGN PROCESS

The group have been divided to the user interface team and the background system team.

The user interface team have created illustrations of menus of the application. They estimate different ways to show the most important aspects of the system while keeping the ease of use and the current state of smartphone applications in mind.

The background system team have focused to the system design and how to allow complex use cases later without making major changes to it. They have been reading publications about other similar studies and searching existing applications.

Together the group have been negotiating about the connections between the user interface and the system. Many practical issues have also been as subjects of discussions.

Give a name

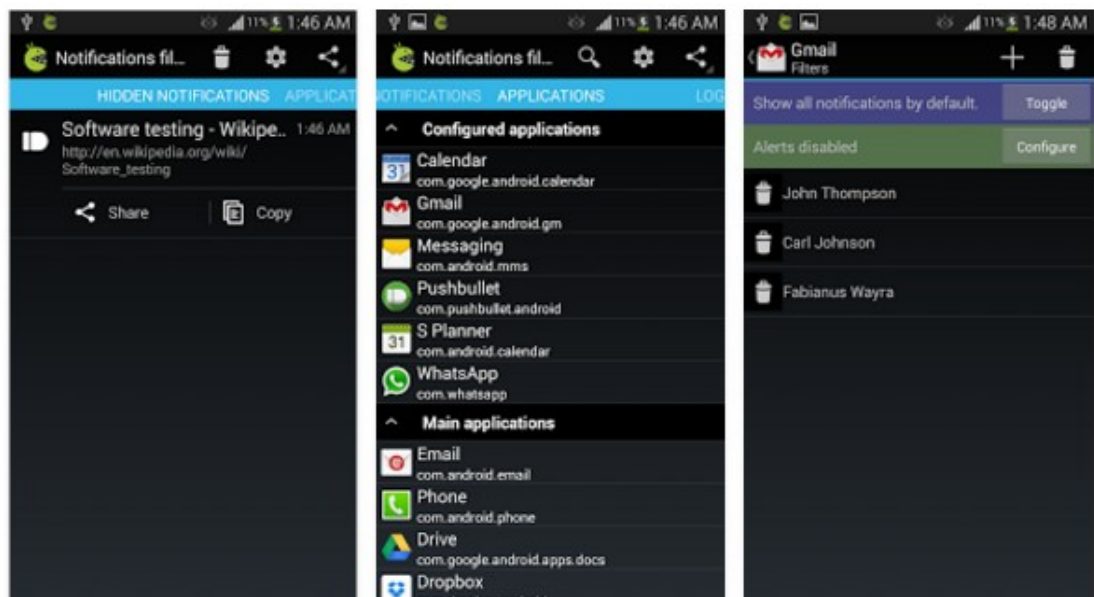

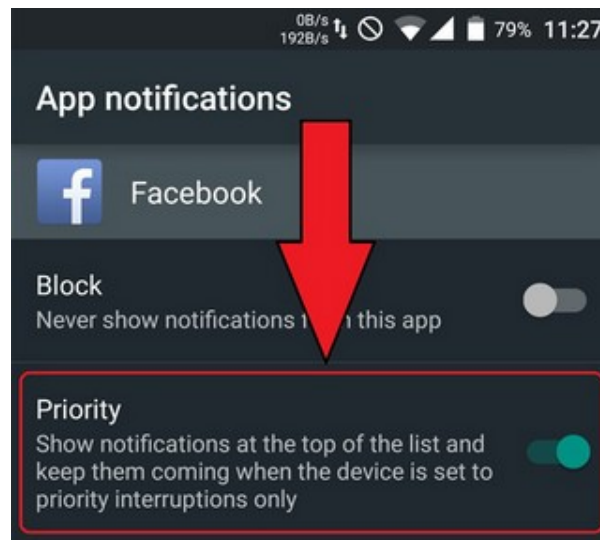

Ok

## 2. STATE OF THE ART

In the literature, many studies cover notifications as a source of disruptions. They examine groups of people and their reactions to different notifications. In the results they take a stand on how people perceived notification importance or how to recognize automatically good times to push a notification.

The designed application as a notification manager have also been covered by many software patents. [4, 5] That might cause difficulties in exporting the application to USA. The unique feature of our application is to read notifications later instead of just removing them.

The market place offers various similar solutions already. The most common feature is to allow blocking notifications of an application. Other features might include the customization of the sound and vibration or keeping the log of all notifications. Upcoming version of the Android operating system will also have a similar built-in feature.

### 3. SCENARIOS AND USE CASES

<b>Use Case</b>	Delay annoying notifications.
<b>Primary Actor</b>	A user, who downloaded the app from the Play-store for free.
<b>Scope</b>	Android OS with NotificationManager running in the background or the foreground.
<b>Level</b>	User Goal
<b>Brief</b>	The user edits a setting which makes annoying notifications to be avoided.
<b>Importance</b>	This have to be implemented.
<b>Postconditions</b>	-
<b>Minimal Guarantees</b>	<ul style="list-style-type: none"><li>• User gets the most important information about success or failure of the usage</li></ul>
<b>Success Guarantees</b>	<ul style="list-style-type: none"><li>• The setting is saved and an updated version is loaded in the engine</li><li>• The version snapshot of the setting is created by the system</li></ul>
<b>Preconditions</b>	<ul style="list-style-type: none"><li>• The user has installed the application</li><li>• The application is launched and the main menu is visible</li></ul>
<b>Triggers</b>	<ul style="list-style-type: none"><li>• The user edits options which affects to initial settings</li><li>• User enables advanced editing mode and adds more custom settings</li></ul>
<b>Basic flow</b>	<ol style="list-style-type: none"><li>1. The system provides the menu, which shows the most relevant options about what and how notifications are processed.</li><li>2. The user modifies options until satisfied.</li><li>3. Settings are saved and loaded to the engine automatically</li></ol>
<b>Extensions</b>	-

<b>Use Case</b>	Make notifications less annoying
<b>Primary Actor</b>	An Android OS user with a Play-store account or with F-Droid installed.
<b>Scope</b>	The whole userspace of the Android OS with a Internet connection.
<b>Level</b>	Summary
<b>Brief</b>	By installing our application, people get a optimized dispatcher for notifications automatically or with very little configuring.
<b>Importance</b>	This could have been implemented.
<b>Postconditions:</b>	
<b>Minimal Guarantees</b>	<ul style="list-style-type: none"> <li>• Users gets a unique footprint with their usual notifications</li> </ul>
<b>Success Guarantees</b>	<ul style="list-style-type: none"> <li>• Users gets a positive feeling about the smartphone taking their experience into account in unique fashion.</li> </ul>
<b>Preconditions</b>	<ul style="list-style-type: none"> <li>• The application is available in the Play store or in the F-Droid</li> <li>• The application can be installed and configured with less or equal steps as in average Android application</li> </ul>
<b>Triggers</b>	<ul style="list-style-type: none"> <li>• The user searches for "notification" in the Play store</li> <li>• The user reads the list of system applications in the F-Droid.</li> </ul>
<b>Basic flow</b>	<ol style="list-style-type: none"> <li>1. The market place connects an Android user to the application</li> <li>2. The user installs and configures the application</li> <li>3. The user feels the benefit of not being distracted without good reason</li> </ol>
<b>Extensions</b>	<ol style="list-style-type: none"> <li>a) Tune the user experience by customizing settings <ol style="list-style-type: none"> <li>1. The user selects advanced settings option</li> <li>2. The system allows detailed tweaking of the setting</li> </ol> </li> <li>b) Show public feedbacks about the application <ol style="list-style-type: none"> <li>1. The user selects Statistics menu</li> <li>2. The system shows anonymized results of polls and other performance measurements</li> </ol> </li> <li>c) Connect to the cloud <ol style="list-style-type: none"> <li>1. The user creates a account to our service</li> <li>2. The system allows storing, loading and viewing existing settings</li> </ol> </li> </ol>

## 4. REQUIREMENTS

Functionality	<p>For users:</p> <ul style="list-style-type: none"><li>• Access to the Play-store, to the F-Droid or to our github frontpage</li><li>• Android 2.3.3 (Android API 10)</li></ul> <p>For developers:</p> <ul style="list-style-type: none"><li>• Android-Studio</li><li>• Amd64 architecture PC or USB-connected Android device</li><li>• Access to GitHub</li></ul>
User interface	<ul style="list-style-type: none"><li>• Most important settings first</li></ul>
Usability	<ul style="list-style-type: none"><li>• Application must be working as expected without additional unwanted features</li></ul>
Security	<ul style="list-style-type: none"><li>• The feedback system must be anonymized</li><li>• The connection to our server must be encrypted</li><li>• The account service may not ask full name or other detailed credentials as they are completely unnecessary</li><li>• Connecting the application with social media services is worse option than using the device ID as a login, because highly anonymized data and avoiding unnecessary liabilities is the primary objective.</li><li>• Passwords must be checked by hash, not by plaintext</li></ul>
Management	<ul style="list-style-type: none"><li>• Our group have meeting with our supervisor once in every two weeks</li><li>• The group chat. Currently WhatsApp.</li></ul>
Standards compliance	<ul style="list-style-type: none"><li>• Compliance with Play-store terms of service</li></ul>
Portability	<ul style="list-style-type: none"><li>• The code must be written entirely in Java to use it with other architectures than ARM.</li></ul>

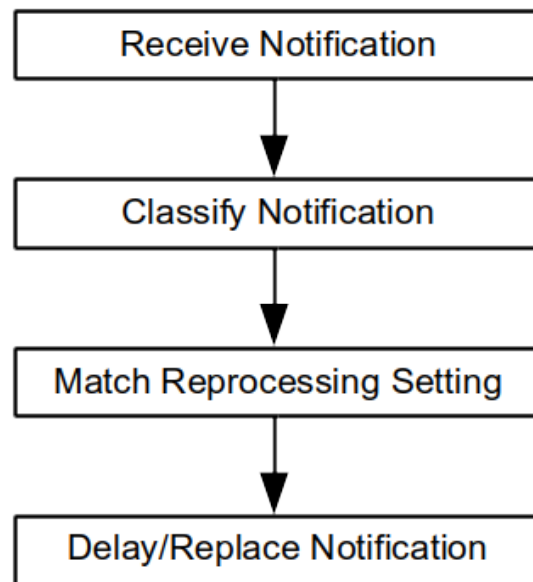

## 5. SYSTEM DESIGN

The main task is to intercept the normal way of flowing of notifications and use our configurable processing instead.

Notifications are being analyzed and classified. All information about the notification is collected and stored structurally in the memory.

The classified notification is then being matched to existing settings. If it does not match, then it will be forwarded and shown to the user as regularly. If it does match, then it will trigger the processing according to the setting.

The processing might cause the notification to be delayed, or modified or blocked entirely.

The whole application will be running from event based function calls instead of a fast loop, which is found e.g. in many games. If there is a need to call some function periodically, then scheduled system calls will be used.

While the application itself does not require an internet connection, the user feedback system requires. Gathering the evaluation data is one of our primary objectives, and it requires a separate server and database connected to the Internet.

## **6. INTERFACE DESIGN**

### **6.1. The main screen**

The main screen is blank containing only the necessary tools for user to be able to create and choose the events they want. The plus button wukk create a new event.

Application buttons open new windows for specific applications so the user can control them and change settings if needed.

The question mark button opens the help screen.

### **6.2. The info screen**

This screen should display some useful information about the specific app which notifications you want to control and information about the control methods.

### **6.3. The settings screen**

This screen should display user some settings to help control application notifications.

### **6.4. The help screen**

The help screen should be accessible from everywhere and should contain some FAQ and contact information. In the case FAQ doesn't answer the question.

### **6.5. Small screen**

Some useful in-between pop-up windows for the program. The program will use app's name as a default but the user can give it a name if he wants.

## 7. USER COMMENTS

To fully understand our future customers and their needs, we asked questions from our potential customers. The purpose of these questions was to give us more information about what kind of features users wish to have and what options the app should have to satisfy the needs of our clients.

Conversations with every potential client took only around 10-15 minutes to keep answers neutral. The answers pointed to the most important features in our app instantly, but they can also inspire in our future research.

Basically we asked:

- *“If you had an app that could delay Facebook or Emails for a time, at what time would you use this ?( referred to examples like work and school)”*.
- *“Do you think this could help you to focus better on your workday or maybe in a meeting, if you couldn’t be disturbed by your phone unless it is an emergency?”*
- *“Which apps would be most important to delay and why these?”*
- *“Do you have anything you would like to add, now that you have a full view of what you could have”?*

After feedback here are the main points our potential clients had:

- *“It would be actually very nice to have an option to delay my facebook , Email, Whatsapp, notification when I go to class, but I’m worried that I won’t remember to turn it back on”*
- *“The settings I make in the app should be saved so I don’t have to change them every time”*
- *“App should be easy to use, like it could have a button to turn it on and off, maybe widget ?”*
- *“Delaying for an hour or to only and then the app would turn off by itself would be nice so I could just select “delay for 2 hours” and that’s all”*

After research analyses, we are more enlightened as a group of our potential customer needs. We have a full picture of the features people want and how they should work in order to satisfy our clients in a best way possible.

## 8. ANALYSIS

The annoyance of push notifications is scientifically known subject. Our project matches that in the analysing of the feedback data.

There are some similar application in Play-store [5, 6]. Being at the same level or competing with them is in the reach of our implementation. Also, with more complex processing system this may be technically more advanced than them, which allows flexible ways to satisfy our customers.

This project is a combination of known parts, both in marketing and scientific perspective, which makes it a good design.

## 9. RISK ASSESMENT

Brief	Not getting enough user feedback
Likelihood	Common
Impact	Minor
Preventive action	Making a working beta version in early phases of the development, and outreaching friends and relatives as test users.
Corrective action	We focus to data which doesn't require user interaction.
